[Healthcare · Product · Working Prototypes](#)

I turn ambiguous problems into working products — in healthcare-adjacent contexts.

[Healthcare Product & Strategy — helping teams decide what to build and how to make it happen.](#)

Every build below started as a real, unresolved problem. Each one is evidence of the same underlying skill, applied to product management, program management, healthcare strategy, and analytics alike.

[See what I've built →](#)[Get in touch](#)**JN**

Jane Natividad — a healthcare product & strategy professional who builds working prototypes to explore problems firsthand, not just describe them.

CAPABILITIES

What this work is built to demonstrate.

Product management, program & portfolio management, healthcare & medical insights, applied AI & analytics — different labels for the same underlying skill: turning an ambiguous problem into something that actually works.

PROJECTS

Real prototypes, real workflows.

Each one started as a genuine problem I noticed — the kind of unglamorous process work that quietly decides whether ambitious teams can do their best work — scoped into something small enough to build alone, and generalized here to stand on its own. Screenshots below show each one running; every

repo is public and ready to read in full.

HEALTHCARE · CLINICAL OPS

Intake, Structured

ai-patient-intake-assistant

THE PROBLEM

Patient-contributed information is often incomplete or inconsistent — someone downstream pays for that gap in time, follow-up, or missed context.

WHAT I BUILT

Structures unstructured patient intake text, flags what's missing or inconsistent, and drafts a follow-up question — before clinical review. It does not diagnose, and nothing is sent without a human deciding to send it.

For: primary care and clinic intake staff who need patient-reported information structured and gap-checked before a clinician reviews it.

Key takeaway: human review is

PROGRAM & PORTFOLIO

The Morning Brief

founder-briefing-copilot

THE PROBLEM

Leaders spend a disproportionate amount of time synthesizing status updates scattered across emails, Slack threads, and meeting notes just to answer: what needs my attention today?

WHAT I BUILT

Turns scattered customer, supplier, and hiring updates into a 30-second RAG status briefing for leadership, with a deterministic keyword fallback so it stays useful even if the AI layer is unavailable.

For: founders, operations leads, and program/portfolio leads juggling status updates from multiple sources who need to know what needs attention today.

Key takeaway: built a deterministic

Key takeaway: Human review is required, not optional — nothing is actioned without a person deciding first.

OPERATIONS

Ready to Schedule

onboarding-ops-copilot

THE PROBLEM

Customer-facing teams often receive requests as a paragraph of email text standing in for a complete intake form — someone has to manually re-read each one before work can be scheduled.

WHAT I BUILT

Transforms unstructured customer requests into a scored, prioritized onboarding plan — identifying what's missing, what to do first, and drafting the follow-up email needed to move forward.

For: operations, lab, and customer-facing teams who receive incoming requests as free-form notes and need a

PRODUCT MANAGEMENT

Prep & Decide

pm-companion-copilot

THE PROBLEM

A lot of the PM job is un-glamorous synthesis work: rereading old notes before a call, or turning a pile of scattered feedback into a decision the team can act on.

WHAT I BUILT

Two lightweight workflows: one preps context ahead of a customer conversation, the other turns unstructured feedback into structured, prioritized product decisions.

For: product managers who spend real time prepping for customer conversations and synthesizing feedback

consistent way to triage them before work is scheduled.

Key takeaway: drafts the follow-up, not just the flag — closing the loop is what actually saves time.

[View on GitHub →](#)

into decisions the team can act on.

Key takeaway: two focused workflows, not one general tool — prep and analysis are different jobs.

PORTFOLIO STRATEGY

One View of the Runway

portfolio-runway-instrument

THE PROBLEM

Early-stage R&D organizations run multiple competing programs against a fixed runway, but the data to answer "what happens if we lose X" is usually scattered across spreadsheets, contracts, and someone's memory.

WHAT I BUILT

A scenario-tested portfolio and runway dashboard — one view of every program, gate, CRO, and budget against the runway, built to answer "what happens if" in seconds, not a deck cycle.

For: founders, R&D leads, and program/portfolio leads at early-stage biotech or life-sciences orgs who need one current view against cash runway and gate criteria.

Key takeaway: built for scenario simulation, not static reporting — shows what changes under pressure.
